

November, 19 2019 M2 Update

A fine morning to get some aerodynamic data!

First test of the tufted M2 tail (still shot from GoPro video at ~80mph). Air is evenly hugging the surfaces. Noticeable to us was the aerodynamic force of the tail.

Tomorrow: Full rudder movement and side load measurements with strain gauge.

This week: First test assembly of the M2, and first hang test (cg calculation for mast).

Safe flying!
